# Preface

*“Life is difficult.” — M. Scott Peck’s, The Road Less Traveled*

It’s too early to write a preface. I started writing this book a few weeks ago. From my perspective, it will be a good one, but it will take some time. In the meantime, you are welcome to see what’s happening here and what I’m writing. Sometimes things will be in the wrong place. This is a normal part of the writing process. Just so you know, I started writing on 15 November 2025.

Text Smolin (2019)

*“The first principle is that you must not fool yourself — and you are the easiest person to fool. So you have to be very careful about that.” — Richard Phillips Feynman and Leighton (1992)*

*“Hic sunt dracones!” — Hic Sunt Dracones on the Hunt–Lenox Globe (eng. “Here be dragons”)*

Richard P. Feynman (1998)

*This book has a German predecessor. You might not recognise this book. That's fine. The page can be found at the following link: <https://jkruppa.github.io/>. However, it is much more unstructured. It is more like a cookbook than this book, which has a continuous storyline.*

# 1 What is science?

Last modified on 18. November 2025 at 20:02:34

“Reality is negotiable.” — Tim Ferriss

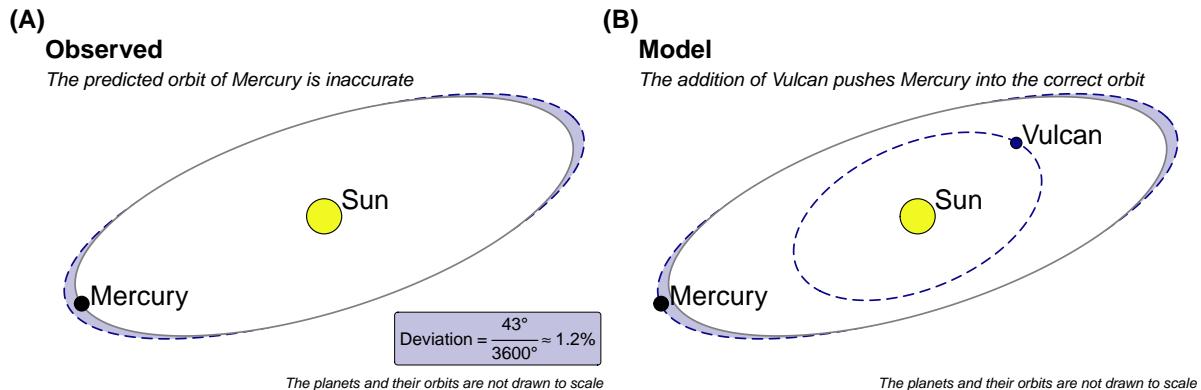

Figure 1.1: foo (A) foo (B) foo

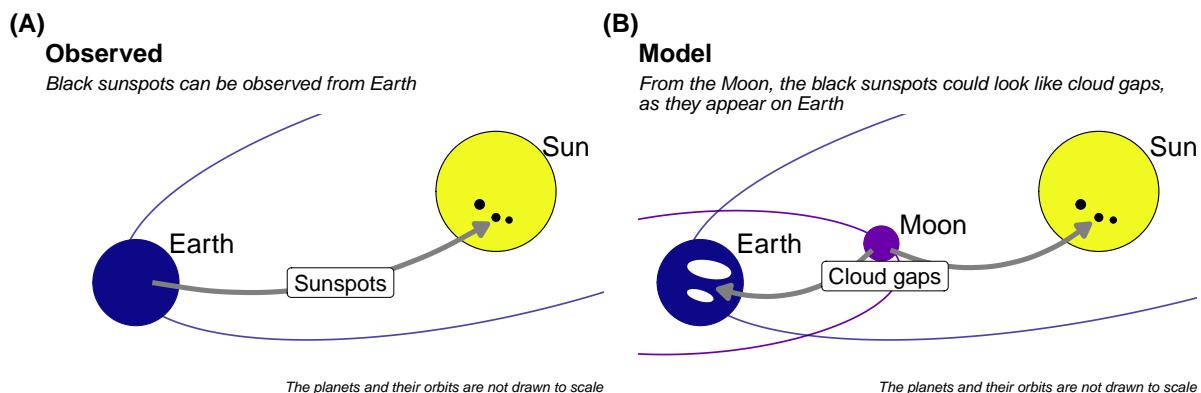

Figure 1.2: foo (A) foo (B) foo

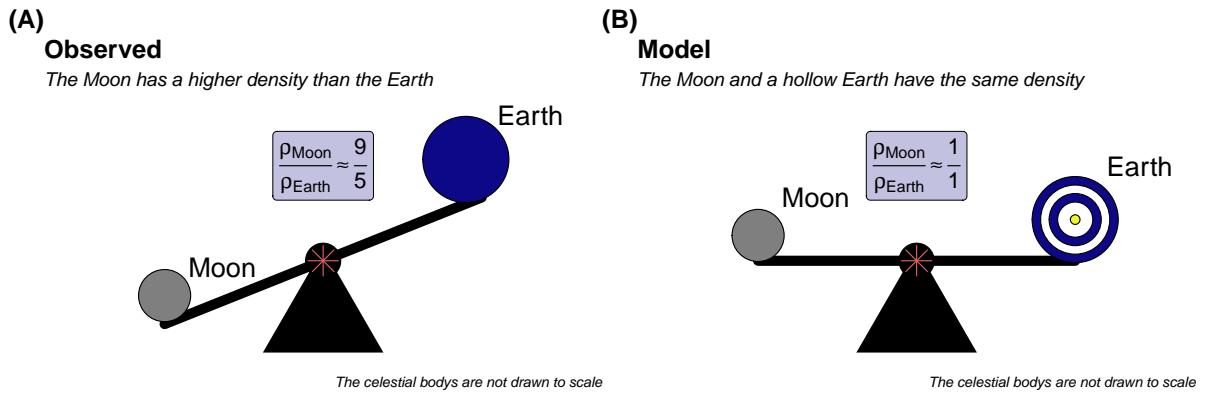

Figure 1.3: foo (A) foo (B) foo

## 1.1 General background

*“Any sufficiently advanced technology is indistinguishable from magic.” — Clarke (1968), Clarke’s third law*

Full quote

*“Reality is negotiable. Outside of science and law, all rules can be bent or broken, and it doesn’t require being unethical.” — Tim Ferriss*

Idea of hypotheses

Science is guessing and falsification

# 2 What is data?

Last modified on 18. November 2025 at 07:21:12

“The limits of my language mean the limits of my world.” — Ludwig Wittgenstein

## 2.1 General background

## 2.2 Theoretical background

## 2.3 R packages used

## 2.4 Data

```
jump_weight_tbl <- tibble(x = c(0.6, 1, 2.3, 3.5, 5.2, 7.1, 8.4, 9.2, 10),
                           y = 0.15*x^3 - 2.2*x^2 + 8.8*x + 3.2 + rnorm(9, 0, 0.5)) |>
  mutate_all(round, 1) |>
  rename(weight_mg = x, jump_length_cm = y)
```

Table 2.1: foo.

weight_mg	jump_length_cm
0.6	7.8
1.0	9.8
2.3	13.1
3.5	13.2
5.2	10.0
7.1	8.4
8.4	10.8
9.2	14.6
10.0	21.6

Equation 2.1

$$y = 0.15 \cdot x^3 - 2.2 \cdot x^2 + 8.8 \cdot x + 3.2 \quad (2.1)$$

# 3 What is a model?

*Last modified on 19. November 2025 at 19:56:20*

*“A quote.” — Dan Meyer*

## 3.1 General background

Table 3.1: Table of terms used in the statistical modelling. The terms in bold are used here. Depending on the scientific background, the usage of these terms can vary widely.

Symbol	Name Application	Description
$y$	<b>out-</b> <b>come,</b> re- sponse, end- point, de- pen- dent vari- able	<i>The right-hand side (abbr. RHS) of the model. Describing the values measured in an experiment or study.</i>

Symbol	Name Application	Description
$x$	<b>in-</b> <b>flu-</b> <b>encer,</b> in- flu- en- tial vari- able, risk fac- tor, fixed ef- fect, in- de- pen- dent vari- able	<i>The left-hand side (abbr. LHS) of the model. Describing the influential variables in an experiment or study.</i>
$z$	<b>ran-</b> <b>dom</b> <b>ef-</b> <b>fect</b>	<i>A factor that provides a description of an grouping variable, which is not part of the controlled experimental setting.</i>
$x$	<b>ex-</b> Explanation <b>plana-</b> <b>tor,</b> ex- plana- tory vari- able	<i>The influencer is used to describe or explain the outcome.</i>
$x$	<b>pre-</b> Prediction <b>dic-</b> <b>tor,</b> pre- dic- tive vari- able	<i>The influencer is used to predict the outcome.</i>

Symbol	Name Application	Description
$x$	<b>fo-</b> Main effect <b>cal</b> <b>ex-</b> <b>plana-</b> <b>tor,</b> <b>fo-</b> <b>cal</b> <b>pre-</b> <b>dic-</b> <b>tor,</b> fo- cal vari- able	<i>In a model with multiple influencers, the focal variable is the variable of primary interest.</i>
$c$	<b>co-</b> Continuous $x$ <b>vari-</b> ate, co- vari- able	<i>The influencer is a numeric variable with continuous values.</i>
$f_A$	<b>fac-</b> Categorical $x$ <b>tor</b> <b>A,</b> fac- to- rial vari- able, cat- e- gori- cal vari- able	<i>The influencer is discrete, functioning as a grouping variable, such as an experimental group or a treatment.</i>
$A.1$ to $A.j$	<b>lev-</b> Factor $f_A$ <b>els,</b> groups, treat- ment groups	<i>The discrete groups included in one factor <math>A</math>.</i>

A sentence why we use  $y$  and not  $x$  for mean and other stuff.

# **Tales of data**

*Last modified on 18. November 2025 at 19:44:46*

*“What problem have you solved, ever, that was worth solving where you knew all the given information in advance? No problem worth solving is like that. In the real world, you have a surplus of information and you have to filter it, or you don’t have sufficient information and you have to go find some.” — [Dan Meyer in Math class needs a makeover](#)*

Here comes the preface text

# 4 Fleas of animals

*Last modified on 19. November 2025 at 19:45:33*

*“A quote.” — Dan Meyer*

## 4.1 General background

## 4.2 Theoretical background

## 4.3 R packages used

## 4.4 Data

Based on standard methods in flea research and experimental entomology, as well as a similar published experiment, the following three types of food for adult cat fleas are possible, representing different nutritional conditions:

Blood: This is the natural and optimal food source for adult fleas. Often, defibrinated or anticoagulated animal blood (e.g. bovine blood, rabbit blood) is used for this purpose, which is offered in special in vitro feeding systems (e.g. through a membrane). Expectation: Fleas that are optimally nourished should show the greatest jumping distance.

Sugar water: Often serves as a ‘control feed’ or as a feed that provides energy (sugar) but lacks essential nutrients (such as proteins from blood). Expectation: Jumping distance could be reduced due to the lack of blood and thus the proteins important for reproduction, which could impair physiological fitness.

Ketchup - a nutrient-poor or unsuitable food: This option is used to simulate poor, incomplete or stressful nutritional conditions. In a similar documented experiment, ketchup (a combination of sugar, vinegar and minimal other substances, but no blood) was used as the third feed. Expectation: It can be assumed that fleas will show the shortest jumping distance under these conditions, as they lack both essential nutrients and the necessary energy.
